Signals and Systems gives a comprehensive coverage of the field of Signals and Systems. This book is for both the undergraduate and postgraduate students of the areas of Signals and Systems, Electrical, Electronics, Electrical Engineering, Mathematics, Physics, Applied Mathematics and Mathematics Education. The introduction to the book provides the basic concepts of signals and systems. It describes the role of signals and systems in the domains of communication, control and measurement. The next sections give a brief history of signal and systems and its application in control, communication, and measurement domains. The book deals with the topics like introduction, basic theory, mathematical models, sampling theory, impulse responses, speech coding, speech-to-speech and speech-to-voice conversion. The book also presents the application of the above topics in important application areas such as communication, measurement, and control. The chapter on sampling theory gives an introduction to sampling theory. The book provides a useful

review of the theory and application of sampling. This chapter starts with an introduction to sampling. It then explains the concept of the finite impulse response (FIR) and infinite impulse response (IIR). This chapter also provides an introduction to the concepts of oversampling and undersampling. The chapter on oversampling states the properties of the sampled signals and how the sampling rate affects the sampled signal. The chapter on undersampling deals with the case when the sampling rate is higher than the data rate. This is important because it shows how the sampling will result in information loss. The book also gives an introduction to the concept of band-pass and band-reject filters. The book covers important topics such as basic theory, sampling theory, IIR filters, FIR filters, approximation, filtering with nonuniform sampling, etc. The first part of the book deals with the applications of sampling and filtering and is divided into different sections. These include: digital communication, digital image processing, digital audio processing, automatic speech recognition, filtering with nonuniform sampling, etc. The later parts of the book deal with signal processing applications such as speech coding, speech-to-
