The present invention relates to a noise suppression device for a motorcycle, and more particularly, to an active noise suppression device for a motorcycle. In addition to the current emission laws for motorcycles, stricter laws requiring motorcycles to pass tests for noise emissions have been put in place, and a motorcycle equipped with a noise suppression device to reduce noise has been developed. A noise suppression device is generally composed of a passive noise suppression device, which simply reduces noise by sound absorption or sound absorption using a passive system such as a soundproofing material and an active noise suppression device, which is also called an active noise suppression system. An active noise suppression system is mainly composed of an active noise cancellation device that receives an interference wave from the outside through microphones to cancel the interference wave, an active noise reduction device that uses a controller to control an operation of the active noise cancellation device and reduce the noise of a vehicle, and an active sound absorption device that uses sound absorbing material or sound absorbing material that absorbs the noise of a vehicle and reduces the noise. In general, when a noise suppression device uses an active noise cancellation device, the active noise cancellation device is mounted on a vehicle and a microphone is mounted on the soundproofing material or sound absorbing material. This noise suppression device receives sound from the outside through the microphone and generates 2d92ce491b
