Additive manufacturing, or 3D printing, has potential applications in many industries including architecture, medicine, manufacturing, national security and space. The process is particularly interesting to those in the space industry, who can apply its enabling technology to constructing space vehicles or satellites or smaller components. However, 3D printing is still at an early stage. Scientists are getting better at printing living tissues, but 3D printing of pure metal remains challenging. Until recently, researchers were not even sure if it was possible. Researchers in the University of Pennsylvania's Department of Materials Science and Engineering and their colleagues in the University of Pennsylvania, Rice University and Empa Swiss Federal Laboratories are addressing the challenge by developing 3D printing techniques for pure metal, and have produced the first pure gold and platinum 3D printed nano-scaffolds for use in biomedical devices. They also produce pure titanium. In tests, the metal scaffolds show promise in preventing bacteria from adhering to medical implants or other equipment, and inhibiting osteoblasts from growing on stainless steel. These types of implants are commonly used for orthopedic devices, heart valves, burn treatments and dental implants. While metallic 3D printing has been achieved, printing all-metal items in clean rooms with strict cleaning guidelines can be challenging. These clean rooms need to be as clean as the space is meant to be. To overcome this challenge, Pennsylvania scientists had to create printing techniques that allow printing in a non-clean room. They used electrochemical methods and acidic etches to coat the stainless steel with a non-conductive layer. They then electroplated gold on the surface and, as a final step, used acid etches to remove the coating. A group of Rice University scientists were able to optimize the etching process by using an electrochemical cell, and a team of Empa Swiss Federal Laboratories researchers developed techniques to coat titanium with the same non-conductive layer. Then, to optimize their process for use with titanium, they found a way to do the electroplating while they used the titanium with a special plating process called atomic layer deposition. Under the conditions used, the 3D printed scaffolds inhibit the growth of bacteria. They also inhibit bone cell growth on the scaffolds. The work is reported in the journal *Advanced Materials*. "Many of the metals we use in our devices are toxic to cells," said Rajesh Rao, an associate professor of materials science and engineering at Penn and the senior author of the paper

What's New in the Adobe Photoshop 2021 (version 22)?

Nuovo sondaggio sulla fiducia nella politica tradizionale L'indagine «Quarta Capitale Futuro» ha intervistato oltre 2.500 esponenti del mondo politico italiano ed è il miglior studi sulla politica e politica italiana di oggi. I partiti di massa hanno ben oltre il 30 per cento dei voti, ma se mettiamo in fila ancora una volta i democratici di centrodestra (29 per cento), nonostante il tracollo del governo Conte-Pezzoni (poco più di 9 per cento), quelli del centrodestra-centre-sinistra (30 per cento) ed i ragazzi delle «5 Stelle» (40 per cento), permette di vedere che in fondo c'è chi pensa la politica come un problema, piuttosto che una soluzione. E chi si è ritrovato nell'esperienza dei populismi, non ama esagerare e, dal canto suo, ama sicuro e fermo alle regole del gioco. Le persone che hanno alimentato la fiducia nella politica tradizionale, la parte del codice essenziale dell'Italia e dell'Occidente, sono: 1) Valori tradizionali: il centro destra (33 per cento), il centrodestra (29 per cento) 2) Morale: il centrodestra (25 per cento), il centro destra (30 per cento), i «ragazzi delle formiche» del «Movimento 5 Stelle» (40 per cento) 3) Costituzionale: «Savio» per il centrodestra (26 per cento), «Leone» per il centro destra (22 per cento) 4) Estero: «Sì» per il centrodestra (20 per cento), «No» per il centro destra (26 per cento)
