
Sip Component V2 9 For Delphi

C Programming & Windows Desktop Projects \$750-\$1500. Voip Component We need to create a component for Delphi 2007/7 that can install Voip. This will allow users to run Voip and listen to Voip. The interface will have a wrapper component that can be associated with a Windows application. This will be very convenient, because it will allow you not to use many components, and it will be easier for the user to understand. We will also use a wrapper bean to manage Voip: we only need to create one and the wrapper bean will be automatically created in the Windows application.
