### What's New in the?

Microsoft Visual Studio Team System 2008 Database Edition GDR supports SQL Server 2008 and is the most advanced version of Database Edition. Database Edition GDR provides a new BULK INSERT clause in the INSERT statement to enable the creation of large amounts of data without the need for multiple INSERT statements. The major differences between Database Edition GDR and the other releases are:

- Database Edition GDR contains the Power Tools 2008 and will be the last release to include the SQL Server 2008 database engine.
- Database Edition GDR features significant changes in the development cycle.
- Database Edition GDR includes significant improvements in the data generator.
- Database Edition GDR contains the new Intrinsic Types and the new .dbschema file format
- Database Edition GDR contains the new support for Extensions.
- Database Edition GDR is the first release to allow developers to deploy SQL Server 2008 database objects as embedded database projects.
- Database Edition GDR includes the ability to perform runtime data verification as well as design-time data verification

The following sections briefly describe the new database objects that are supported by Database Edition GDR.

#### Schema View

The database schema is now represented by a new file, the .dbschema file. The .dbschema file consists of three sections;

- The first section contains all the information that was present in the .dbschema file (primarily for backwards compatibility).
- The second section contains all of the SQL Server database objects including:
  - Tables
  - Views
  - Indexes
  - The structure and membership of all foreign keys
  - Asymmetric keys
  - Symmetric keys
  - User defined functions
  - Events
- The last section contains an xml section that provides a mapping to the database objects and metadata about the database objects. The xml mapping provides additional information not present in the .dbschema file.

#### Database Projects

Database projects enable the same project to be used for multiple databases. A Database Project includes a number of database project templates that are organized into a hierarchy. The Database Project is a complete self contained unit that contains everything needed to maintain a database.

- There are two types of database projects that are supported by Database Edition GDR: Database Project and Server Project.
- A Database Project allows the same database to be deployed to multiple databases. In a distributed scenario where a central database is maintained by the team, it is common to have a Database Project containing the central database
