KeyMACRO Keymacs is a utility that has been designed to help you easily access macros files (often called AppleScripts) on your hard drive. The program integrates with the Script Menu (Mac menu) and offers you the ability to easily launch and save those macros using a single click. KeyMACRO is a simple utility that, first of all, enables you to access your macros directly from the Script Menu in all your files. This way, you can launch a macro file just like any other application, for instance Photoshop or AppleWorks, using the File menu, with the possibility of saving and/or opening it right after. Once you have chosen to open a file from the Script Menu, you will be asked if you want to run it as a macro or as an application (such as Photoshop). In the latter case, you will be asked if you want to save it with the current name, as a new file or with a different name. If you want to open it with a different name, it will be saved in a temporary location for you to choose from. If you want to keep the same name, you will be asked if you want to overwrite the current one or keep it. As far as launching a new file, you will be asked if you want to open it in your default application, a folder or from the Script Menu. Each macro is stored in its own tab in the Macro section, where you can view their information, create new ones and manage your existing ones. It includes the following information: Tab - Name - Date - Module (all the keystrokes used to perform a specific function) - Description (which is the same as the name) - Description (which is the same as the name) - Action (a brief description of what the macro does) - Keyboard Shortcut (which you can easily change if you prefer something else) - Script (which is the name of the
