

PDF | Remote sensing is an important method for monitoring marine oil spills. However, methods for measuring oil film thickness remain. Scientists from the Institute of Oceanology, P.P. Shirshov RAS (IOC RAS), Institute of Oceanology, P.P. Shirshov Russian Academy of Sciences (IORAN) and other institutes of the Russian Academy of Sciences and Moscow State University conducted a study of ground and remote sensing methods to assess the thickness of the oil film and its impact on the behavior of the marine ecosystem. In particular, the article describes two different remote sensing methods that were used to measure the thickness of the oil film from a shipboard using two radars.
