What's New in the ContactGrabber?

ContactGrabber is an information retrieval software to get contacts, phone numbers, fax numbers and emails from different data sources and save them in CRM systems. ContactGrabber helps you grab contacts and addresses from your address book with one click! Use ContactGrabber for saving leads and contacts with one mouseclick from e-mails, websites or other text documents. ContactGrabber works with Outlook, SAP-CRM, SAP R/3, salesForce, MS-CRM, FileMaker, vCard, sugarCRM, Lotus Notes, Excel, Outlook Express. ContactGrabber analyses the adresses and transfers the formatted data to CRM systems. Don't waste time with typing any more! Simply select a contact information block from any source (mail, website, or document) and call ContactGrabber. ContactGrabber extracts the contact information and adds it into corresponding fields of your CRM automatically. Easily build lead lists from websites and online directories. It took a lot of work to analyze the reports and configure the various service application entities. I don't know if this is an improvement or not but I will give it a try. By the way I have configured the minimum number of service applications. If you want more you can add them. After that I have a no errors in the log files. No traceback whatsoever. You have to configure the service application fields in the meta data entities. You have to have the default values in the programm. I have set the values to be the same as in the data source. I have also configured the minimum number of service applications. The changes seem to be in place. For most of the default settings I chose an over view. A summary was printed out. It only prints out the totals of the various summary fields. I have not found any other way to view the individual values. I have found a few bugs. The first time I run the script it adds one of the service applications. If I run the script again it removes one of the service applications. After that I have it properly add the service application and print out the correct data. In the program I have to set the program to Add database objects instead of importing them. In the GUI there is no option for it. If you want to import you have to set the "Import" to "Add" for the service application. That seems to work now. Thanks again for your effort. It took a while to do this. Your help is much appreciated. I have fixed all of the bugs and it is working like a charm. I have tried to add a valid email address. The text "Invalid e-mail address" was printed out. It did not remove any contacts. I am thinking that it is reading the invalid entry. It is very good that it does not crash. From the help I found a script that uses the

System Requirements:
