External applications are written in an application programming interface (API) such as VBA, AutoLISP, Visual LISP, C++, Python, Ruby or other languages, which automate workflows in AutoCAD or in a related program, such as Microsoft Office. This is usually done through the use of AutoCAD object model or, more often, through the use of the API of a third-party application. Such applications are usually designed to work on a single machine, but they may also be network applications designed for use across a corporate intranet or the Internet. AutoCAD is the de facto standard application of the Autodesk company. In addition to basic use, the software is used to create parametric models, create charts for mathematics and statistics, create GIS models, record and analyze CAD data and generate CAD drawings. There are more than 100 plug-ins available for AutoCAD to extend its functionality. These include tools for geometric

modeling and structural analysis, color control, registration, 2D and 3D design, visualization, collaboration, web and mobile applications, product lifecycle management, and more. While some plug-ins are free and some are available for a monthly subscription, most are purchased. The workflows of AutoCAD may be automated with the use of plugins created by Autodesk, or third-party solutions may be used. Such third-party solutions are usually applications that work on a single machine or work via the API. The automated workflow may be limited to a specific functionality, such as drawing a full-scale drawing from a one-off engineering drawing created using an application that has a parameterized drawing workflow. Multi-user environments AutoCAD supports a multi-user environment. Each user who connects to the network has their own CAD instance (AutoCAD session) which stores their work. The user connects to a server running AutoCAD and sets up a session with access to a

shared drive for data storage. The server computer can be a network computer running a multi-user operating system or a dedicated computer. Each computer connected to the network is identified by a name and a user name.

The computer with AutoCAD is designated as "AutoCAD@NetworkMachineName". Multi-user environments have two primary operating modes: Client/Server mode, where the software on the client side runs the application and provides the user interface. Client software is connected to the server, which has access to the shared drive
