The implications of parenting same-sex attracted (SSA) parents have only been partially understood, and the impact of parenting children of one's own biological sex versus those of another sex has yet to be examined. The present study investigated whether ratings of parental attachment were related to risk for SSA in a sample of SSA mothers and the perceived impact of parenting their own biological sex versus a different sex. Quantitative and qualitative data were obtained via an online survey (n = 256). Overall, the results indicated that high levels of awareness of SSA was not related to better attachment to the parent, or lower levels of parental stress, and that a better understanding of one's own biological sex (sisters) was more strongly associated with levels of attachment and parental stress than having a different biological sex (brothers). SSA mothers did report more negative attachment experiences and greater stress than heterosexual mothers, but the negative associations with attitudes toward their own sex was not greater than that between SSA mothers and their own sex (bisexual mothers). The study is the first to document the familial context of parenting a child of one's own biological sex versus another sex.Q: Get the 16th bit of an int Possible Duplicate: How to get the last 16th of a uint16 in Rust? In the case of a server, this is most often used to wake a computer when a network packet containing commands is received. Suspicious WOL packets can also be detected by the Cisco SAINT platform, and this is what Cisco reported about the most recent WOL-DDoS attacks against Cisco devices. The WOL-DDoS packets come in at a very low rate: it is possible to receive as few as ten per second. Nonetheless, this number could increase, as the same DDoS attacks that originated more than two years ago have continued. Additionally, WOL-based attacks are referred to as Stealth-WOLs (sometimes referred to as Stealth WOL attacks). As mentioned above, the WOL packets typically originate from the same IP addresses as those that originated the previous attacks against Cisco devices. Last week, we wrote about a DDoS-related WOL attack that impacted two important websites: Dominoe Cafe and Monster World Cup. It is important to note that these two domains are legitimate and it is also possible to read about them on specialized sites, as coverage of this event. As mentioned in our previous post, WOL-based DDoS attacks are common and most of them target websites whose owners are based in the United States. This is why it is possible to find highly similar attacks on the NANOG mailing list, where visitors may find information about the latest WOL-related attacks. The NANOG mailing list is primarily an online discussion forum about the Internet of Things (IoT
