Everyone agrees that print and multimedia display technologies are essential to the development of efficient communication in the information age. Computer printers, computer displays, computer scanners, digital cameras and the Internet have all contributed to improving the possibilities of modern communication. However, the existing products lack a standardized, comprehensive solution for printing, multimedia presentation and document management. Users have to use various devices, applications and operating systems to meet their needs. The need for an Open ePrint standard in the information society becomes clear. Like in the existing communication systems, end-users and information technology companies must cooperate to achieve the common goal of digitization. This cooperation is also important to the printers and other equipment companies, who need to be part of the solution to make sure the end-user can obtain the necessary support to meet the demands of digitization. The Open ePrint technology is based on the Open ePrint Architecture. The Architecture is a stable architecture that allows vendors to implement it in the way they think is best. The Open ePrint Architecture defines the following core functionality: User interface and interoperability Printing and presentation applications The architecture is designed to enable interoperability with other application products that form part of the solution. It defines the capabilities that should be part of the solution and not part of the architecture. The Open ePrint Architecture provides the base for the standard. The definition of the standard also builds on the existing Open ePrint Architecture, so the standard can be easily implemented. The standard enables vendors to optimize their existing solutions for printing, presentation and document management. The Open ePrint Architecture provides a comprehensive design that allows for a fast and flexible development. This is achieved by combining three concepts: The Open ePrint Architecture provides extensive support for optional features such as integration with other resources and interoperability. It does not specify every function and service. Instead it specifies the key functions and services that will be used by users, and how vendors should interact with them. In general, the standard must be compatible with the functions and services of the architecture, but this is not a requirement. An Open ePrint standard that is widely used and well defined can avoid problems and lead to the development of a vendor-independent solution that would normally require extensive custom development. The standard provides a common set of capabilities to enable vendors to focus on differentiating their products. Open ePrint provides the Open ePrint Architecture in a standard format that is available to all interested parties. The architecture is in the Open Document Architecture
