Category: Emulators Category: Direct-x based emulators**On double-slit interference with a black hole** **Y.X. Liu** *Institute of Theoretical Physics, College of Physics and Electronic Engineering, *Sichuan University, Chengdu 610064, China* [^1] Abstract This paper analyzes the effects of the quantum gravitational force (QGF) on the wave function of double-slit interference. It is found that the intensity of the diffraction pattern will be changed due to the QGF. We also find that the position of the new interference pattern caused by the QGF depends on the size of the black hole and the wavelength of the incoming waves. We show that the QGF has obvious effects on the interference pattern in various different kinds of double-slit interference, and analyze the results from the viewpoint of the QGF. PACS number: 04.70.Dy Keywords: Quantum gravitational force (QGF), double-slit interference 1. Introduction {#sec1-1} ===== The quantum gravitational force (QGF) is induced by the quantum effect of gravity, and the strength of this force for a particle of mass m is $F_{\text{QGF}} = \left(- \frac{mGM_{\text{BH}}}{r^2} \right)^{1/3}$ where M_{BH} is the mass of the black hole. It is well known that the wave function of the particles in quantum field theory will be changed by the QGF [2]. In other words, the quantum gravitational force plays an important role in the interference pattern of the photons. Double-slit interference is an important kind of interference phenomenon, which is usually used to test the size of the microscopic particles. In the double-slit experiment, the interference of the light (or electron) is very obvious if the wavelength of the light is very long, but it becomes unclear if the wavelength of the light is very short.
