I would love to start a Top 300, but I would be dealing with so many other issues right now it would be a very time consuming task. That said, I would LOVE to throw some of the topics together and make an amazing Top 300. I had the same thoughts but I found the same issues in doing it. Also, I would say that at least one of my topics would have to have at least 1 or 2 of those classes as the poster. I didn't want to make you a poster, though...Phylogeography and B chromosome variation of Australian species of *Scolopax*. We investigated the evolution of the B chromosome system in species of *Scolopax*, a speciose group of viviparous birds with a long evolutionary history in Australia and New Guinea. The chromosomal constitution of 12 species of *Scolopax* were compared with two species of *Cinclosoma* and one species of *Dinornis*, three closely related species that have retained the ancestral karyotype. In addition to the complete chromosomal constitution, a detailed analysis of species-specific variation of the B chromosome system was also performed in nine of the 12 *Scolopax* species. The data showed high species-specific differences in the B chromosome system. For example, the B chromosome of *Neocossus choeropus* comprises 4 to 18 small chromosome-sized heterochromatic blocks that are dispersed throughout the metaphase. The B chromosome of *Eudytula novaehollandiae* also comprises a non-centromere chromosomal segment in almost all metaphases that is much longer than the small blocks of *E. choeropus*. Each of the two species of *Cinclosoma* has a small B chromosome with a similar composition and size. The B chromosome of *Dinornis novaehollandiae* is heterochromatic and contains a large complex of small heterochromatic segments and/or blocks. The data suggest that the B chromosome of species of *Scolopax* originated from a species of

Is a powerful macro recording utility that lets you save time and get things done in record time. Without a doubt, it's the fastest recorder out there. We've been in the recording business since 1997. We know what we are doing. The primary purpose of any recording utility is to let users record their actions as fast as possible. The fact that each of the actions can be performed in a single window should not be taken for granted, so a focus on design was crucial. As far as the interface goes, there are many options that allow users to configure the recording preferences, as well as the parameters used to record the macro. If you want to get the most out of your record macros, this is the recording utility to use. This article will discuss one of the programs I've been using for the last 10 years or so. Its name is Fast File Synchronizer, or FFS for short. I've been using FFS for the last 10 years or so, and it's been pretty much my solution for file synchronizing. The interface is straightforward and intuitive. When you run it, it shows a small window with a main area, and a toolbar above that. The main area is where you can select the files to synchronize, and in the toolbar you'll find the options to configure the synchronization process. There are several configuration options. You can set the synchronization type (individual, folder or drive) and the frequency with which it will be executed. If you want to be able to start and stop FFS on demand, you can enable this, too. More than the synchronization type, you can select a directory, and then specify what action will be performed. You can either synchronize with (Rename) a specific file or (Move) all the files of a folder, for example. This is a much more powerful feature than FFS 1.0. The update interval When you run the FFS program, it will start synchronizing the files in the selected directories. This is indicated by the two icons in the main area. You can use the "Go to any time" function to move to the current time and time to go to the next one. You can also use the "Show controls" function to set the current update time. If you move the mouse cursor to the right, a small window will appear with the current date and time displayed. This is especially handy if you have several synchronized folders. FFS's main window As I've already mentioned, FFS provides several configuration options. You can set the update interval, the time to synchronize a specific file or folder, to have the program run with Windows, to start and stop FFS on demand and other information. To do this, you need to open the configuration window, which will be the first window you'll see when you run the FFS program. To open the configuration window, select it from the main window using the "Show configuration" function, or from the toolbar. The configuration window provides four tabs where you can configure all the options. The first tab gives you a quick-access view to the different
