PCR-based analysis of antibiotic resistance genes and phylogenetic typing in water and wastewater: implications for pathogen treatment and drinking water quality. The presence of antibiotic resistance genes (ARGs) and enterococci in treated sewage and drinking water can be problematic for public health and drinking water quality. Traditional methods for pathogen monitoring such as cultivation, PCR-based detection and phylogenetic typing require a minimum number of samples and are sensitive for detection of pathogens at or below a given level. A simplified, high-throughput PCR-based method was developed to detect the presence of 32 ARGs, comprising multiple types of beta-lactamase genes, methicillin-resistance genes and quinolone resistance genes. The method was tested on wastewater and surface waters at 18 sites in North America and
