Leptin is a peptide hormone secreted by adipose tissue and plays a role in energy homeostasis and body weight. Leptin is the first adipokine that has been identified and it serves as a link between nutrition and the immune system. The discovery of leptin and its identification as a hormone has stimulated the research on leptin and obesity because of its therapeutic potential. It has become an important target to develop new therapeutic approaches for the treatment of obesity. Leptin-mimetic peptides share the same or similar properties as the biological leptin molecule, but they have the advantage of being orally active and non-invasive. In this review, different peptides mimicking the leptin activity with different mechanisms are presented and the potential development of new therapies in the clinic is discussed.# Copyright 1999-2020 Gentoo Authors # Distributed under the terms of the GNU General Public License v2 EAPI=7 # ebuild generated by hackport 0.6.1 CABAL_FEATURES="lib profile haddock hoogle hscolour" inherit haskell-cabal DESCRIPTION="Aging library providing common functions for aging" HOMEPAGE="" SRC_URI="" LICENSE="MIT" SLOT="0/${PV}" KEYWORDS="~amd64 ~x86" IUSE="" RDEPEND=">=dev-haskell/blaze-builder-0.1:=[profile?] =dev-haskell/engine-ghc-8.0.1:=[profile?]
