In the following lessons, we will look at many Photoshop image editing features, including the basics and some more advanced features. Raster and Vector Editing Photoshop can be used to create and edit images in two ways. The first is with the use of a raster image editor that renders pixels to the screen as needed. Vector images, such as those created with Adobe Illustrator, can be changed directly using a vector editor in Photoshop. Photoshop has both a raster and a vector editor. Raster tools work directly with pixels, and are best for editing raster-based images. A vector editor is designed to manipulate points and lines, and is best used with vector images. Vector images can be created in Adobe Illustrator or another raster graphics program and then imported into Photoshop. First Steps To see the first step of an editing task, double-click the image (image.psd) in the Photoshop document window. This displays a UI toolbox that holds the tools you need to work on the image. If Photoshop is the only program you are running, the only tools available in the toolbox are the basic tools for creating and designing a composition. For example, the "Blend Modes" option in the toolbox is the only way to change the color of an image. These tools include: The "Text" tool controls text placement on the page, add new text objects, or create new characters. The "Layers" tool enables you to create and organize layers of a document. The "Paintbrush" tool paints or draws shapes and paths. The "Curves" tool allows you to make adjustments to a photograph's brightness or color. There is also an option called "Layer Styles" that lets you apply visual effects to selected objects. Figure 3 is an example of the toolbox. Photoshop has tools to manipulate color, contrast, and levels, as well as a host of other editing tasks. These tools are found in the main toolbox or the secondary toolbox. To access these options, use the menu command Edit, choose image edit, or double-click an image file to open the toolbox. Once the toolbox is open, you can use the following four functions to edit the image, as well as create and delete layers. Changing a Layer's Opacity The Levels tool The Color tool The Sharpen tool The Dodge tool To change a layer's opacity, double-

I have set up another server in another location that serves static files. I am using Cloudflare CDN to host images. From the one server, I go through a proxy to the other server (192.168.1.10 -> 81.48.247.68) to get to the other server. The problem is that the internet (over the proxy) is a different IP to the internet (over the other server). Cloudflare can only be configured for one IP at a time. If I go to I get the error "This is not permitted". If I add www. to the URL, I get "Not authorized (The website owner must have a website hosting account
